ZOMATO ANALYTICS

Power BI Data Analyst Portfolio Project

Restaurant • Orders • Customers • Revenue • Ratings • Delivery Performance

Project objective
Build an interactive Power BI dashboard using a Zomato-style food delivery dataset to analyze business performance, customer behavior, restaurant performance and delivery operations.

Note: The included dataset is synthetic and created for portfolio/practice purposes. It is not official Zomato company data.

1. Dataset & Business Questions

The Excel dataset contains 1,200 synthetic food-delivery orders across 10 Indian cities. Use it as the source file in Power BI.

Field	Purpose
Order_ID	Unique order identifier
Order_Date	Time-series analysis
City / Restaurant	Geographic and restaurant analysis
Cuisine	Cuisine performance
Customer_Segment	Customer-level comparison
Order_Value / Delivery_Fee	Revenue analysis
Discount	Promotion analysis
Rating	Customer satisfaction
Delivery_Time_Min	Operations analysis
Payment_Method	Payment behavior
Profit	Profitability analysis

Business questions: Which cities generate the most revenue? Which cuisines are most popular? Which restaurants have high ratings and order volume? What is the average delivery time? How do discounts affect profit? Which customer segment contributes most revenue?

2. Power BI Dashboard – Page 1: Executive Overview

Top KPI cards: Total Orders | Net Revenue | Total Profit | Average Order Value | Average Rating | Average Delivery Time

Visuals:

• Line chart: Monthly Net Revenue
• Bar chart: Revenue by City
• Donut chart: Orders by Customer Segment
• Column chart: Revenue by Cuisine
• Map: Orders/Revenue by City (if map visuals are enabled)
• Slicers: Year, City, Cuisine, Customer Segment, Payment Method

Dashboard layout: KPI cards across the top → monthly trend in the center → city/cuisine charts below → slicers on the left.

3. Page 2: Restaurant & Cuisine Analysis

• Top 10 restaurants by orders
• Top 10 restaurants by revenue
• Cuisine-wise orders and revenue
• Average rating by cuisine
• Average order value by restaurant
• Scatter chart: Rating vs Orders
• Restaurant and cuisine slicers

4. Page 3: Customer & Order Analysis

• Orders by customer segment
• Revenue by segment
• Average order value by segment
• Payment method distribution
• Discount distribution
• Monthly order trend
• City × customer segment matrix

5. Page 4: Delivery & Profitability

• Average delivery time by city
• Delivery time by cuisine
• Profit by city and cuisine
• Discount vs Profit scatter chart
• Profit margin KPI
• Orders with delivery time above 45 minutes
• Low-profit / high-discount restaurant table

6. DAX Measures

Total Orders

Total Orders = DISTINCTCOUNT(Orders[Order_ID])

Net Revenue

Net Revenue = SUM(Orders[Net_Revenue])

Total Profit

Total Profit = SUM(Orders[Profit])

Average Order Value

Average Order Value = AVERAGE(Orders[Order_Value])

Average Rating

Average Rating = AVERAGE(Orders[Rating])

Avg Delivery Time

Avg Delivery Time = AVERAGE(Orders[Delivery_Time_Min])

Profit Margin

Profit Margin = DIVIDE([Total Profit],[Net Revenue],0)

Total Discount

Total Discount = SUM(Orders[Discount])

7. Portfolio Insights to Look For

Do not invent final findings. After building the dashboard, write 5–8 insights based on your actual visuals. Examples of the type of insight to investigate:

• A city may lead in order volume but not in profit.
• Premium customers may have higher average order values.
• Some cuisines may receive strong ratings but lower order volume.
• High discounts may be associated with lower profit.
• Longer delivery times may appear in specific cities or cuisines.

8. GitHub Repository Structure

9. GitHub README – Short Version

Zomato Analytics Dashboard | Power BI

An end-to-end Power BI portfolio project analyzing food-delivery orders, restaurants, customers, revenue, ratings, delivery performance and profitability. The project demonstrates data cleaning, data modeling, DAX, interactive

dashboard design and business analysis.

Tools: Microsoft Power BI, Power Query, DAX, Excel
Skills: Data Cleaning • Data Modeling • KPI Development • DAX • Data Visualization • Business Insights

10. How to Build It in Power BI

1. Download the Excel dataset below.
2. Open Power BI Desktop → Get Data → Excel.
3. Load the Orders sheet.
4. Check data types and clean the data in Power Query.
5. Create the DAX measures in this PDF.
6. Build the four dashboard pages using the recommended visuals.
7. Add slicers and interactions.
8. Test filters and totals.
9. Export dashboard screenshots and upload the project to GitHub.

Portfolio tip: Upload the .pbix file, dataset, screenshots, DAX documentation and a strong README. This makes the project much more useful to recruiters than uploading screenshots alone.
